US WIRELESS ACCESS CONTROL

Wireless
Access Control

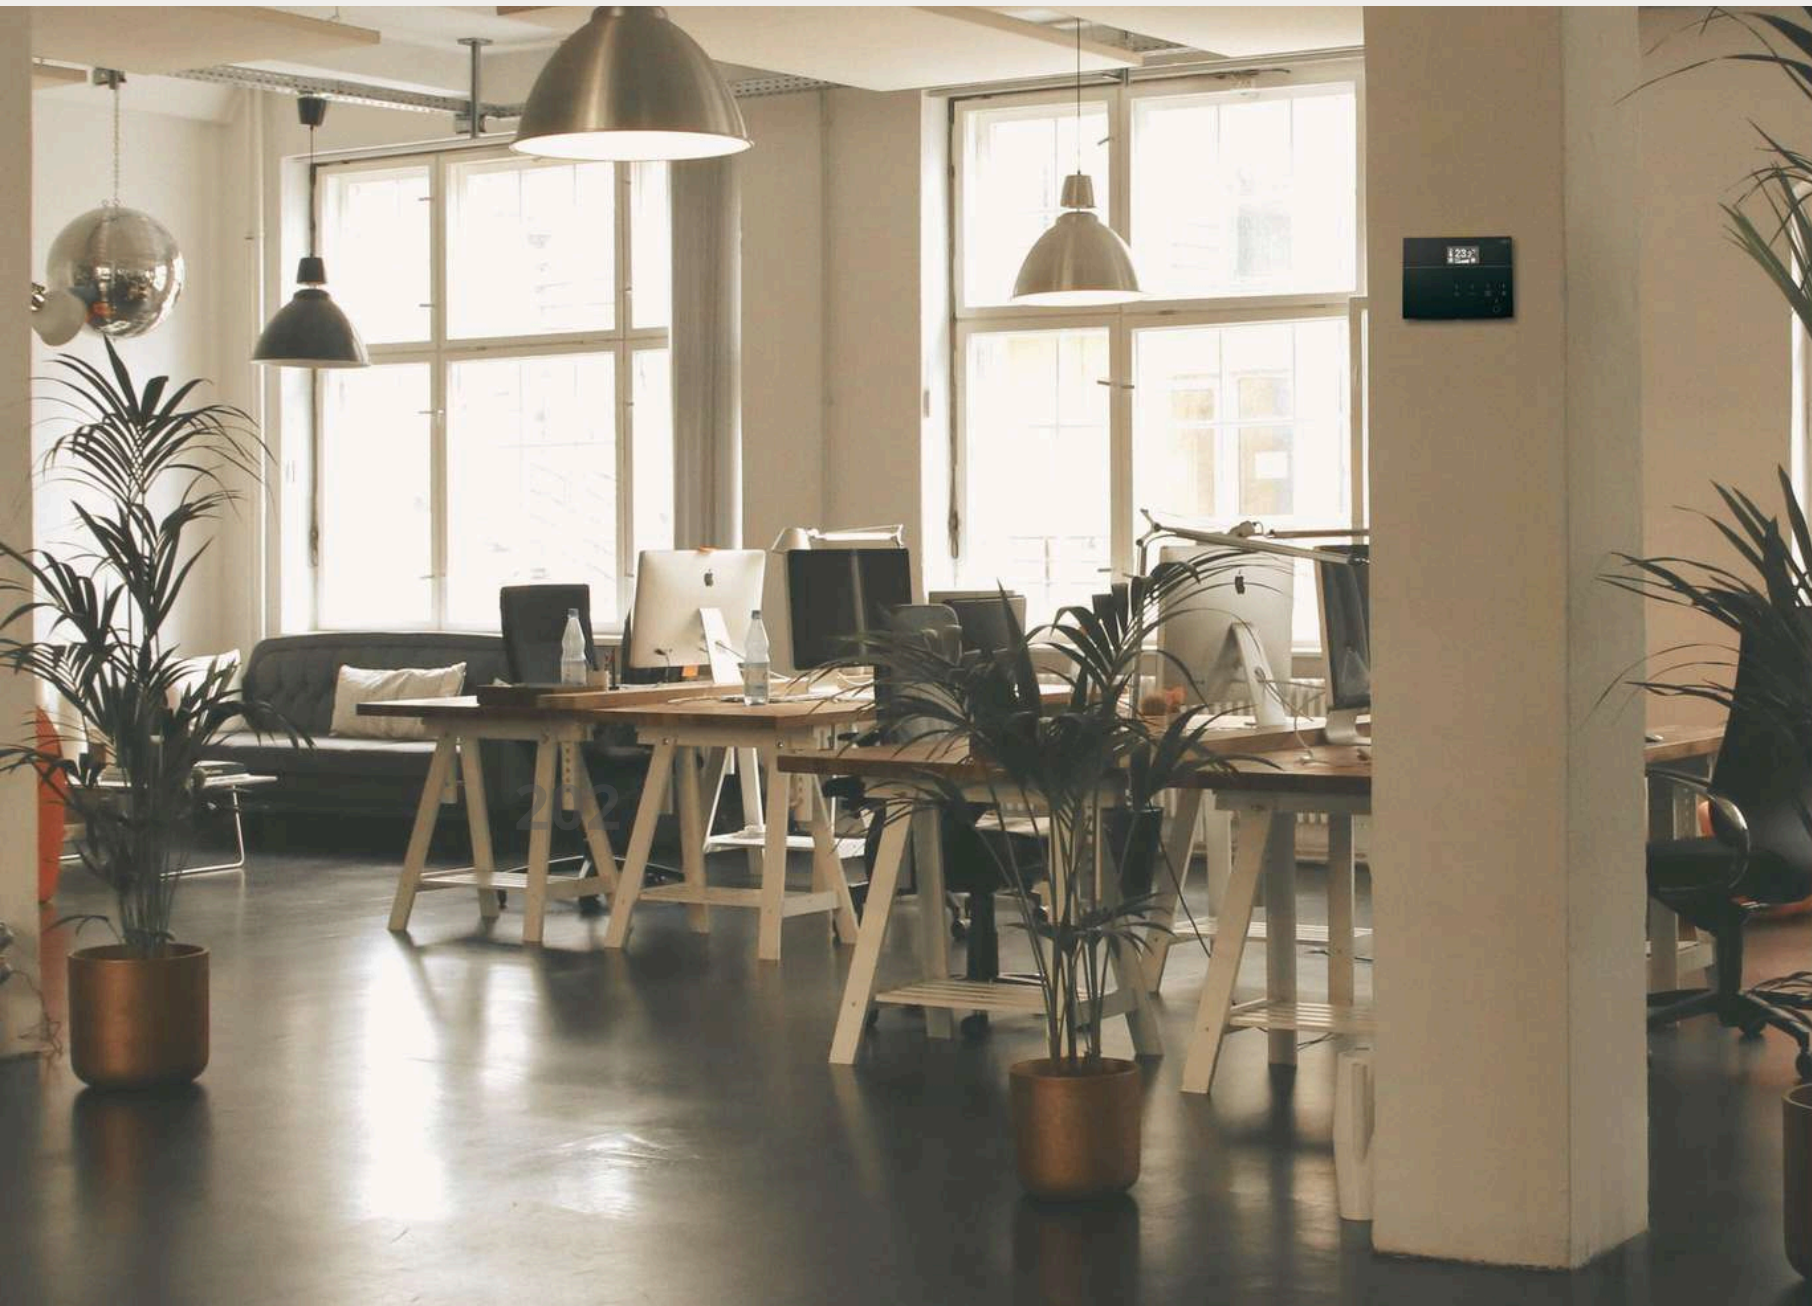

Wireless made simple

A professional solution for secure, centralized access management—designed for environments where reliability, control, and ease of installation are essential.

What is ^{HCS}**NEXUS**

HCS NEXUS is a wireless access control system designed to manage entrances, presence, and authorizations in a secure and structured way.

The system enables control of doors, elevators, and access points through a single platform, providing organized, secure, and easily manageable operations—even in complex environments.

NEXUS is based on a wireless ZigBee architecture, eliminating the need for complex wiring and invasive interventions. This approach reduces installation time and minimizes disruption to ongoing operations. It is particularly suitable for existing buildings, operational facilities, and sensitive environments.

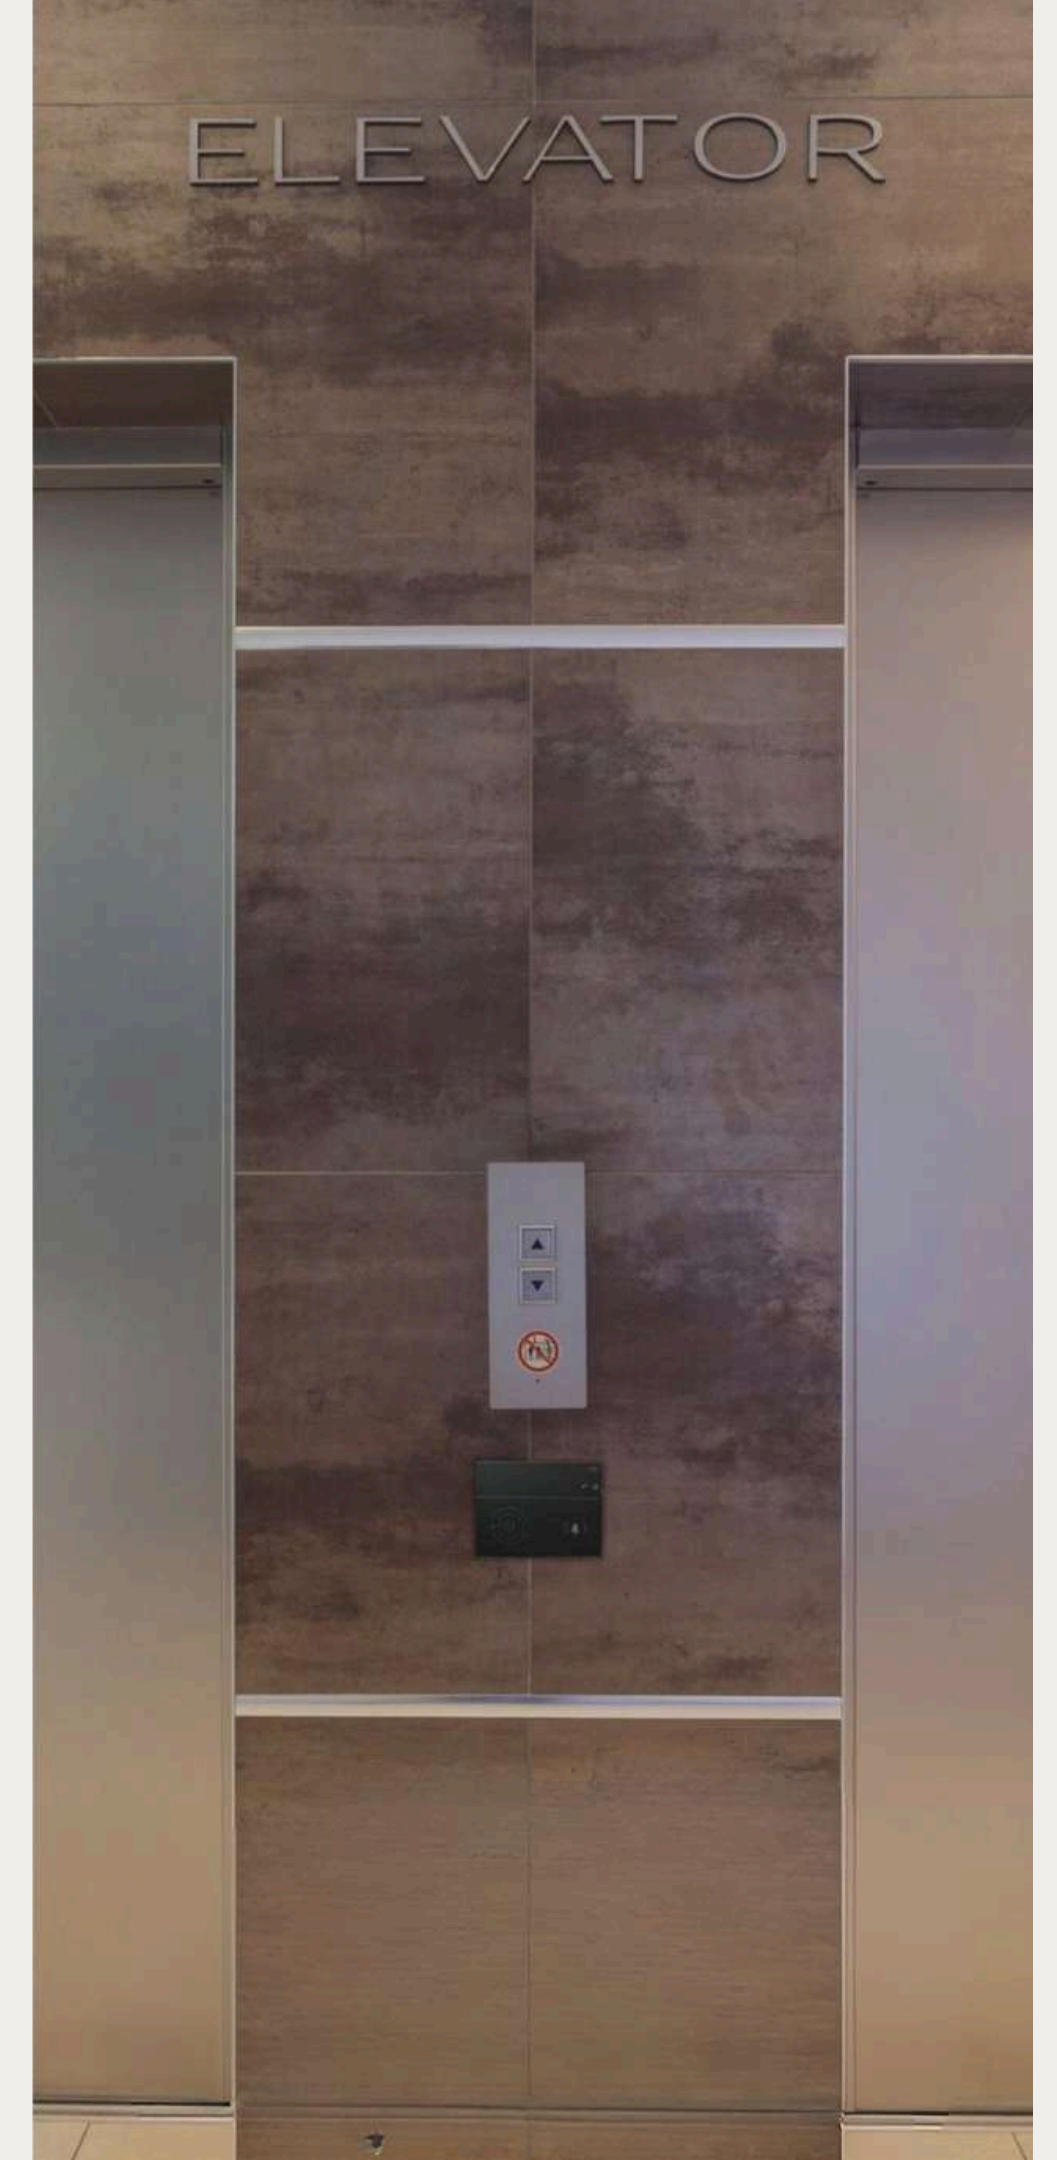

How it works

NEXUS uses access control devices installed near the areas to be monitored, communicating via ZigBee wireless technology with the management software through the Vision-Connect Gateway.

NEXUS devices, featuring elegant glass touch interfaces, can also be installed in outdoor environments thanks to specialized waterproof and thermal treatments.

Each user is assigned specific permissions via badge or numeric code, defined according to roles, time schedules, and accessible areas.

When access is requested, the system verifies the permissions and grants or denies entry, recording the event and making it visible in real time within the software.

Online Control

Thanks to the management software, NEXUS enables continuous real-time monitoring of access events.

The system records not only authorized entries, but also unauthorized access attempts and forced door openings.

This information allows for prompt intervention, enhancing the overall security of the facility and providing full traceability of events with maximum ease.

A modern office interior featuring a meeting table with several chairs, large windows on the left, and glass-walled offices on the right. The word "Benefits" is overlaid in the center.

Benefits

NEXUS offers concrete advantages for everyday access management:

Real-time
monitoring of all
access points

Detection of
forced entry
attempts

Enhanced security
and operational
control

Centralized control
and management
through a single
software platform

Fast and easy
wireless
installation

A system designed to simplify management and enhance the protection of environments.

Wireless adaptability

NEXUS is adaptable to any type of building. It is ideal for healthcare facilities, clinics, nursing homes, institutional buildings, educational environments, offices, and corporate headquarters.

NEXUS is the perfect wireless access control solution, providing visibility, security, and real-time control.
